The skeletal system is the body system composed of bones and cartilage and performs the following critical functions for the human body: supports the body; facilitates movement; protects internal organs; produces blood cells; stores and releases minerals and fat; Support, Movement, and Protection

6.1 The Functions of the Skeletal System | Anatomy and ...

The interaction between the skeletal system and the muscular system is so constant that sometimes the two organ systems are referred to as one system—the musculoskeletal system. Skeletal muscles must be attached to something at either end to give them support while they contract. Typically this means each end of a skeletal muscle is attached to a bone. According to Hillendale Health, when a muscle contracts, it brings the two bones closer together.
