Electromagnetic brakes slow or stop motion using electromagnetic force to apply mechanical resistance. They were originally called "electro-mechanical brakes," but over the years the name changed to "electromagnetic brakes", referring to their actuation method. Since becoming popular in the mid-20th century, especially in trains and trams, the variety of applications and brake designs has increased dramatically, but the basic operation remains the same. Both electromagnetic brakes and eddy curre

In the automotive industry, brake-by-wire technology is the ability to control brakes through electrical means. It can be designed to supplement ordinary service brakes or it can be a standalone brake system. This technology is widely used on all hybrid and battery electric vehicles, including the Toyota Prius. Brake-by-wire is also common in the form of the electric park brake which is now widely used on mainstream vehicles. The technology replaces traditional components such as the pumps, hose

The dynamic stability control system (DSC) is the main control unit of the electro-mechanical parking brake (EMF). When the engine running or the vehicle on road: The parking brake hydraulically acts on the disc brakes on the front and rear axles via DSC. When the engine is off and the vehicle is stationary: The parking brake is applied to the drum brake of the rear axle by means of an electro-mechanical servo unit. The release action can be triggered by pressing the parking brake button, and ...
