complex topics. For the Eighth Edition, this successful formula has been refined with updated research, applications, and links to an enhanced Microbiology Place Website/CD-ROM. Supported by a powerful new Art and Photo CD-ROM for instructors, this new edition provides the most current coverage, technology, and applications for microbiology students.

The twelfth edition focuses on big picture concepts and themes in microbiology, encouraging students to visualize and synthesize more difficult topics such as microbial metabolism, immunology, and microbial genetics.

Microbiology: An Introduction helps you see the connection between human health and microbiology.

In an effort to simplify the complex world of laboratory testing and diagnosis, this easy-to-use guidebook was developed by an experienced educator in response to student demand. Using clear, easy-to-understand terminology, this everyday reference covers common lab tests and testing methods. Causes of conditions, signs and symptoms, lab findings, normal values and ranges, and interpretation of results are also addressed. This resource covers the need-to-know aspects of lab tests and diagnoses with a student-friendly approach, a focus on key content, and outstanding visual tools to help engage the student in the subject matter. "Did You Know" boxes provide additional key facts as quick references throughout the book! Every health care student and professional

Lyme borreliosis (LB) is caused by spirochetes within the *Borrelia*

## Read PDF Microbiology 9th Edition Tortora Test Bank

**Burgdorferi sensu lato complex** and is the most common tick-transmitted disease in the northern hemisphere. The transmission of the spirochetes to humans in Europe is done by the *Ixodes ricinus* ticks, which can also transmit the relapsing fever species *Borrelia miyamotoi*. LB may cause clinical manifestations in the skin, in the central nervous system, in joints, and in the heart. Diagnosis of LB is mainly based on the patient's medical history, self-described symptoms, and clinical signs in combination with the detection of *Borrelia*-specific antibodies (serological methods). In some cases/issues, detection of *Borrelia*-specific deoxyribonucleic acid (molecular methods) may be used as a complement to serology. All diagnosed LB infections are treated with antibiotics to prevent disease

Progression, and most patients fully recover without further sequelae. The overall aims of this thesis were to evaluate molecular and serological tools for laboratory diagnosis of LB, with a special focus on Lyme neuroborreliosis (LNB), and to identify potential improvements. The results presented in this thesis showed that the immunoglobulin (Ig) G assays, currently in use in northern Europe for detection of antibodies in serum, had high diagnostic sensitivity (88 %) together with comparable results both between and within assays. For the IgM assays, the diagnostic sensitivity was lower (59 %) with more heterogeneous results. Small variations in diagnostic performance for IgM and IgG were mainly presented for samples within the borderline zone. These results support

the theory that separate testing of IgM antibodies in serum has low diagnostic value. However, simultaneous detection in serum and cerebrospinal fluid (CSF) for both IgM and IgG antibodies was essential for the diagnosis of LNB, at least for certain assays. So far (to our knowledge), no systematic evaluation and optimisation of the pre-analytical handling of CSF samples before molecular testing has been performed. By use of the precipitate concentrated by moderate centrifugation, extraction of total nucleic acid followed by reverse transcription to complementary deoxyribonucleic acid, in combination with the absence of polymerase chain reaction (PCR) inhibitors, detection of *Borrelia garinii*, *Borrelia afzelii*, *Borrelia burgdorferi sensu stricto*, and *B. miyamotoi* was possible. These four

species are all known to be pathogenic to humans. The results revealed a high analytical sensitivity and specificity for the optimised pre-analytical conditions. The thesis also presents results showing that the real-time PCR protocols currently used in Scandinavia have high analytical sensitivity, specificity, and concordance. This indicates that the low diagnostic sensitivity for detection of *Borrelia* in CSF was not a result of poorly designed and evaluated PCR protocols, but was possibly due to the low number of spirochetes in the samples. However, to further evaluate the diagnostic performance for detection of *Borrelia* in CSF by PCR, clinical samples need to be evaluated based on our new recommendations for the pre-analytical handling of CSF samples. In conclusion, this thesis

Ref presents results revealing that both molecular and serological tools for detection of *Borrelia* have, in general high sensitivity and specificity with results comparable between different protocols and different laboratories. It also presents recommendations for pre-analytical handling of CSF samples before PCR-analysis, and shows the benefits in diagnostic performance by simultaneous detection of IgM and IgG antibodies in serum and CSF for accurate diagnosis of LNB. Even though the techniques mentioned above have high analytical performance, the ability to discriminate an active infection from a previous one is limited and further studies need to be carried out. These studies need to focus on finding diagnostic tools that can help physicians to determine ongoing infection to ensure adequate

treatment. It is also desirable to improve the standardisation of the diagnostic tools and to find methods that can discriminate between different *Borrelia* species. Borrelios är den vanligaste fästingöverförda sjukdomen på norra halvklotet och orsakas av bakterier inom *Borrelia burgdorferi sensu lato* gruppen. Överföringen av bakterier till människa i Europa sker via *Ixodes ricinus* fästingar, vilka även överför bakterien *Borrelia miyamotoi* som ger återfallsfeber.

Borreliainfektioner uppvisar kliniska uttryck i huden, i det centrala nervsystemet och i leder. En borrelia-diagnos baseras främst på patientens medicinska historia i kombination med kliniska tecken, egenbeskrivna symptom samt påvisning av *Borrelia*-specifika antikroppar (serologiska metoder). Vid vissa frågeställningar

## Read PDF Microbiology 9th Edition Tortora Test Bank

kan påvisning av *Borrelia*-bakteriens arvs massa (molekylärbiologiska metoder) användas som komplement till antikroppstester. Alla diagnostiserade borreliainfektioner behandlas med antibiotika för att förhindra utveckling av sjukdomen och merparten av patienterna blir fullt återställda. Det övergripande syftet med avhandlingen var att utvärdera metoder för påvisning av *Borrelia*-specifika antikroppar samt *Borrelia*-specifik arvs massa, men fokus på neuroborrelios, samt identifiera potentiella förbättringar. De metoder som används för påvisning av immunoglobulin (IgG)-antikroppar (uppträder sent i en infektion) i serum i norra Europa uppvisar hög känslighet (88 %) med jämförbara resultat både mellan och inom en analysmetod. Vid påvisning av IgM-antikroppar

# Read PDF Microbiology 9th Edition Tortora Test Bank

(uppträder tidigt i en infektion) i serum uppvisas lägre känslighet (59 %) och mer olikartade resultat. Små variationer i den diagnostiska förmågan att påvisa IgM och IgG-antikroppar beror till stor del på att flera prover erhållit gränsvärden d v s ett värde som inte kan anses som positivt men inte heller som negativt. Resultaten från denna studie indikerar att påvisning av IgM-antikroppar i serum har lågt värde vid diagnostik av *Borrelia*. Dock bör parallell analys av både IgM och IgG-antikroppar i serum och ryggmärgsvätska utföras vid påvisning av neuroborrelios. I dagsläget (till vår kännedom) har ingen systematisk utvärdering och optimering av det preanalytiska tillvägagångssättet vid påvisning av *Borrelia*-specifik arvsmassa i ryggmärgsvätska genomförts. Genom

att använda pelleten (bottensatsen som erhålls genom måttlig centrifugering), framrening av total nukleinsyra i kombination med frånvaro av material som kan påverka PCR-reaktionen på ett negativt sätt (inhibitorer), kan påvisning av Borreliaarterna *Borrelia garinii*, *Borrelia afzelii*, *Borrelia burgdorferi sensu stricto* och *B. miyamotoi* ske. Dessa *Borrelia*-arter är alla patogena för människa. De realtids-PCR protokoll som i dagsläget används i Skandinavien har hög analytisk känslighet, tillförlitlighet och överensstämmelse. Detta tyder på att den låga känslighet som uppvisas vid påvisning av *Borrelia*-specifik arvs massa i ryggmärgsvätska inte beror på dåligt utvärderade och designade PCR-protokoll, utan är troligtvis orsakad av låg

**Bakteriemängd** i proverna. För vidare utvärdering av den diagnostiska förmågan att påvisa *Borrelia*-specifik arvs massa i ryggmärgsvätska med PCR, bör kliniska prover samlas in och analyseras utifrån de nya rekommendationerna för pre-analytiskt tillvägagångssätt vid analys av ryggmärgsprover. Sammanfattningsvis visar resultaten i denna avhandling på generellt hög känslighet och tillförlitlighet samt överensstämmelse mellan olika protokoll/test vid påvisningar av *Borrelia*specifika antikroppar och *Borrelia*-specifik arvs massa. I avhandlingen presenteras även rekommendationer för pre-analytiskt tillvägagångssätt vid omhändertagande och transport av ryggmärgsvätska till laboratoriet. Resultaten visar även på nyttan i att analysera ryggmärgsvätska och serum

parallellt för både IgM och IgG-antikroppar för att erhålla rätt diagnos vid frågeställningen neuroborrelios. Ovan nämnda metoder har trots god prestanda svårt att i alla lägen särskilja en aktiv infektion från en tidigare genomgången, varpå vidare studier krävs. Framtida studier bör fokusera på att finna diagnostiska verktyg som hjälper läkarna att urskilja en pågående infektion så att patienten erhåller passande behandling. Det är också mycket viktigt att arbeta vidare mot en standardisering av de diagnostiska metoderna samt finna metoder som har möjlighet att särskilja mellan olika *Borrelia*-arter.
