Situation. First, do no harm. To intubate or not to intubate an infant born through meconium-stained amniotic fluid (MSAF) has been a question that has challenged this often-quoted principle of first doing no harm, with the answer evolving significantly since the publication of the first Neonatal Resuscitation Program (NRP) guidelines >30 years ago. 1 Those who trained and practiced in the 1980s and 1990s ...

infants born through MSAF who are nonvigorous was published in October 2015.<sup>5,6</sup> The NRP recommended implementation of these guidelines on or before January 1, 2017.

### *To Suction or Not to Suction*

This recommendation represented a shift from the long-standing paradigm on how nonvigorous infants with MSAF should be resuscitated at the time of delivery.<sup>3</sup> In early studies on the management of infants with MSAF, it was suggested that all infants with MSAF should be intubated at birth and meconium be suctioned from below the infant's vocal

Instructor Update

*Neonatal Resuscitation: What you need to know!*

Neonatal resuscitation concepts that were reaffirmed in the 2020 guideline include the following. Delay umbilical cord clamping for uncomplicated term and preterm neonates. This allows the baby to be placed on the mother immediately, dried and assessed for breathing, tone and activity.

with full resuscitation skills, including endotracheal intubation. Do you know how the 7th edition NRP materials originate?

## *Summary of the Revised Neonatal Resuscitation Guidelines*

Before the 2005 guidelines, management of a newborn with meconium-stained amniotic fluid included suctioning of the oropharynx and nasopharynx on the perineum after the delivery of the head but before the delivery of the shoulders.

## *Amniotic Fluid*

If meconium is present - clear the baby's mouth and nose and dry the baby, stimulate it, and reposition it. If meconium is absent - check to see if the baby is vigorous, meaning that the baby has a heart rate over 100 bpm, good muscle tone, and is making respiratory efforts. If the baby is vigorous - behave as if meconium were present

## *NRP Study Guide - National CPR Association*

- Meconium-stained amniotic fluid is a perinatal risk factor that requires at least 2 team members at the birth. A person with

aspiration syndrome (MAS).

*Suctioning: Who, When and Why?*

BACKGROUND AND OBJECTIVES: Recently, the Neonatal Resuscitation Program (NRP) recommended against routine endotracheal suctioning of meconium-stained nonvigorous newborns but suggested resuscitation with positive pressure ventilation. Our purpose is to study the effects of this change in management.

*Delivery Room Management of Meconium-Stained Newborns and ...*

## File Type PDF Nrp Guidelines Meconium

Unfortunately, studies by Wiswell et al did not find that the intervention of suctioning in vigorous meconium-stained infants led to a decrease in the incidence of MAS.<sup>14-16</sup> Moreover, the intubation procedure may cause distress and airway injury.<sup>17</sup> In 2000, the Neonatal Resuscitation Program (NRP) guidelines suggested mouth and pharynx ...
