Nucleophilic Substitution - The Organic Chemistry Review

In the term S N 2, S stands for 'substitution', the subscript N stands for 'nucleophilic', and the number 2 refers to the fact that this is a bimolecular reaction: the overall rate depends on a step in which two separate molecules (the nucleophile and the electrophile) collide. A potential energy diagram for this reaction shows the transition state (TS) as the highest point on the pathway from reactants to products.

Nucleophilic substitution reactions and electrophilic additions, together with elimination reactions, are generally all the reactivity covered in any introduction to organic chemistry courses. To further dive into the concept of electron density, let's look back at our first example in the previous section.

The Most Important Basic Organic Chemistry Concepts

In the substitution reaction between a halogenoalkane and OH⁻ ions, the hydroxide ions are acting as nucleophiles. For example, one of the lone pairs on the oxygen can attack the slightly positive carbon. This leads on to the loss of the bromine as a bromide ion, and the -OH group becoming attached in its place.

C. Elimination vs. Substitution - Chemistry LibreTexts

In organic chemistry, we will learn about the reactions chemists use to synthesize crazy carbon based structures, as well as the analytical methods to characterize them. We will also think about how those reactions are occurring on a molecular level with reaction mechanisms. Simply put, organic chemistry is like building with molecular Legos.

What's Included: Unimolecular Substitution SN1; Unimolecular Elimination E1; Bimolecular Substitution SN2; Intramolecular Substitution Reactions (Cyclizations) Bimolecular Elimination E2

Substitution and Elimination Reactions – Organic Chemistry ...

Substitution and elimination reactions are among the most common in organic chemistry. It is key to understand how and when these reactions happen. This section focuses on three concepts necessary for an understanding of substitution and elimination: the rate law, the leaving group, and the nucleophile. The Rate Law

For each we analyze the substitution dependent upon: a) the type of nucleophile and b) the site of substitution (primary, secondary, or meso). Along with this we evaluate this route as a synthetic strategy for the generation of unsymmetrical porphyrinoids. Distinct trends can be identified for each type of porphyrinoid discussed, regardless of nucleophile.
